The amount of light that reaches the film or image sensor is proportional to the exposure time. . the use of shutter speeds 34 stops slower (exposures 816 times longer). Time-lapse photography is a technique whereby the frequency at which film frames are captured (the frame rate) is much lower than that used to view the sequence. When played at normal speed, time appears to be moving faster and thus lapsing. For example, an image of a scene may be captured once every second, then ..
